PYRAZOLOPYRIDINE DERIVATIVES AS SELECTIVE COX-2 INHIBITORS

CROSS-REFERENCES TO RELATED APPLICATIONS

This application is a Rule 371 Application of PCT Application No. EP99/08186, filed 1 Nov. 1999, which claims priority to GB Application Serial No. 9824062.5, filed 3 Nov. 1998 and GB Application Serial No. 9920909.0, filed 3 Sep. 1999.

BACKGROUND OF THE INVENTION

This invention relates to pyrazolo[1,5-a]pyridine derivatives, to processes for their preparation, to pharmaceutical compositions containing them and to their use in medicine.

The enzyme cyclooxygenase (COX) has recently been discovered to exist in two isoforms, COX-1 and COX-2. COX-1 corresponds to the originally identified constitutive enzyme while COX-2 is rapidly and readily inducible by a number of agents including mitogens, endotoxin, hormones, cytokines and growth factors. Prostaglandins generated by the action of COX have both physiological and pathological roles. It is generally believed that COX-1 is responsible for the important physiological functions such as maintenance of gastrointestinal integrity and renal blood flow. In contrast the inducible form, COX-2, is believed to be responsible for the pathological effects of prostaglandins where rapid induction of the enzyme occurs in response to such agents as inflammatory agents, hormones, growth factors and cytokines. A selective inhibitor of COX-2 would therefore have anti-inflammatory, anti-pyretic and analgesic properties, without the potential side effects associated with inhibition of COX-1. We have now found a novel group of compounds which are both potent and selective inhibitors of COX-2.

DETAIL DESCRIPTION OF THE INVENTION

The invention thus provides the compounds of formula (I)

and pharmaceutically acceptable derivatives thereof in which:

R^0 and R^1 are independently selected from H, halogen, C_{1-6} alkyl, C_{1-6} alkoxy, or C_{1-6} alkoxy substituted by one or more fluorine atoms;

R^2 is H, C_{1-6} alkyl, C_{1-6} alkyl substituted by one or more fluorine atoms, C_{1-6} alkoxy, C_{1-6} hydroxyalkyl, SC_{1-6} alkyl, $C(O)H$, $C(O)C_{1-6}$ alkyl, C_{1-6} alkylsulphonyl, C_{1-6} alkoxy substituted by one or more fluorine atoms; and

R^3 is C_{1-6} alkyl or NH_2 .

By pharmaceutically acceptable derivative is meant any pharmaceutically acceptable salt, solvate, ester or amide, or salt or solvate of such ester or amide, of the compounds of formula (I), or any other compound which upon administra-

2

tion to the recipient is capable of providing (directly or indirectly) a compound of formula (I) or an active metabolite or residue thereof.

It will be appreciated by those skilled in the art that the compounds of formula (I) may be modified to provide pharmaceutically acceptable derivatives thereof at any of the functional groups in the compounds. Of particular interest as such derivatives are compounds modified at the benzenesulphonamide function to provide metabolically labile benzenesulphonamides.

Acylated benzenesulphonamide derivatives are of especial interest. Examples of such benzenesulphonamide derivatives include:

N-alkylcarbonylbenzenesulphonamides;

N-alkoxyalkylcarbonylbenzenesulphonamides;

N-alkoxycarbonylbenzenesulphonamides;

N-arylcarbonylbenzenesulphonamides;

N-alkoxycarbonylalkylcarbonylbenzenesulphonamides

N-carboxylalkylcarbonylbenzenesulphonamides

N-alkylcarbonyloxyalkylcarbonylbenzenesulphonamides;

N-alkylaminoalkylcarbonylbenzenesulphonamides; and

N-dialkylaminoalkylcarbonylbenzenesulphonamides.

With reference to such benzenesulphonamide derivatives, and by way of example only, alkyl may be C_{1-6} alkyl or C_{1-6} alkyl substituted by one or more halogen (e.g. chlorine) atoms; alkoxy may be C_{1-6} alkoxy or C_{1-6} alkoxy substituted by one or more halogen (e.g. chlorine) atoms; and aryl may be phenyl or substituted phenyl.

It will be appreciated by those skilled in the art that the pharmaceutically acceptable derivatives of the compounds of formula (I) may be derivatised at more than one position.

It will be further appreciated by those skilled in the art that benzenesulphonamide derivatives of formula (I) may be useful as intermediates in the preparation of compounds of formula (I), or as pharmaceutically acceptable derivatives of formula (I), or both.

It will be appreciated that, for pharmaceutical use, the salts referred to above will be the physiologically acceptable salts, but other salts may find use, for example in the preparation of compounds of formula (I) and the physiologically acceptable salts thereof.

Suitable pharmaceutically acceptable salts include: acid addition salts formed with inorganic or organic acids, preferably inorganic acids, e.g. hydrochlorides, hydrobromides and sulphates; and alkali metal salts, formed from addition of alkali metal bases, such as alkali metal hydroxides, e.g. sodium salts.

The term halogen is used to represent fluorine, chlorine, bromine or iodine.

According to a further aspect of the invention, we provide a method of treating a human or animal subject suffering from an inflammatory disorder, which method comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable derivative thereof.

According to another aspect of the invention, we provide the use of a compound of formula (I) or a pharmaceutically

6

acceptable derivative thereof for the manufacture of a therapeutic agent for the treatment of a condition which is mediated by selective inhibition of COX-2.

According to another aspect of the invention, we provide the use of a compound of formula (I) or a pharmaceutically acceptable derivative thereof for the manufacture of a therapeutic agent for the treatment of an inflammatory disorder.

It is to be understood that reference to treatment includes both treatment of established symptoms and prophylactic treatment, unless explicitly stated otherwise.

It will be appreciated that the compounds of the invention may advantageously be used in conjunction with one or more other therapeutic agents. Examples of suitable agents for adjunctive therapy include pain relievers such as a glycine antagonist, a sodium channel inhibitor (e.g. lamotrigine), a substance P antagonist (e.g. an NK₁ antagonist), acetaminophen or phenacetin; a matrix metalloproteinase inhibitor; a nitric oxide synthase (NOS) inhibitor (e.g. an iNOS or an nNOS inhibitor); an inhibitor of the release, or action, of tumour necrosis factor α ; an antibody therapy (e.g. a monoclonal antibody therapy); a stimulant, including caffeine; an H₂-antagonist, such as ranitidine; a proton pump inhibitor, such as omeprazole; an antacid, such as aluminium or magnesium hydroxide; an antifatulent, such as simethicone; a decongestant, such as phenylephrine, phenylpropanolamine, pseudoephedrine, oxymetazoline, epinephrine, naphazoline, xylometazoline, propylhexedrine, or levo-desoxyephedrine; an antitussive, such as codeine, hydrocodone, carmiphen, carbetapentane, or dexamethorphan; a diuretic; or a sedating or non-sedating antihistamine. It is to be understood that the present invention covers the use of a compound of formula (I) or a pharmaceutically acceptable derivative thereof in combination with one or more other therapeutic agents.

The compounds of formula (I) and their pharmaceutically acceptable derivatives are conveniently administered in the form of pharmaceutical compositions. Thus, in another aspect of the invention, we provide a pharmaceutical composition comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof adapted for use in human or veterinary medicine. Such compositions may conveniently be presented for use in conventional manner in admixture with one or more physiologically acceptable carriers or excipients.

The compounds of formula (I) and their pharmaceutically acceptable derivatives may be formulated for administration in any suitable manner. They may, for example, be formulated for topical administration or administration by inhalation or, more preferably, for oral, transdermal or parenteral administration. The pharmaceutical composition may be in a form such that it can effect controlled release of the compounds of formula (I) and their pharmaceutically acceptable derivatives.

For oral administration, the pharmaceutical composition may take the form of, for example, tablets (including sublingual tablets), capsules, powders, solutions, syrups or suspensions prepared by conventional means with acceptable excipients.

For transdermal administration, the pharmaceutical composition may be given in the form of a transdermal patch, such as a transdermal iontophoretic patch.

For parenteral administration, the pharmaceutical composition may be given as an injection or a continuous infusion (e.g. intravenously, intravascularly or subcutaneously). The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles and may contain formulatory agents such as suspending, stabilising and/or

US 7,223,772 B1

dispersing agents. For administration by injection these may take the form of a unit dose presentation or as a multidose presentation preferably with an added preservative.

Alternatively for parenteral administration the active ingredient may be in powder form for reconstitution with a suitable vehicle.

The compounds of the invention may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds of the invention may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

As stated above, the compounds of the invention may also be used in combination with other therapeutic agents. The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof together with a further therapeutic agent.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above together with a pharmaceutically acceptable carrier or excipient comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

When a compound of formula (I) or a pharmaceutically acceptable derivative thereof is used in combination with a second therapeutic agent active against the same disease state the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

A proposed daily dosage of a compound of formula (I) for the treatment of man is 0.01 mg/kg to 500 mg/kg, such as 0.05 mg/kg to 100 mg/kg, e.g. 0.1 mg/kg to 50 mg/kg, which may be conveniently administered in 1 to 4 doses. The precise dose employed will depend on the age and condition of the patient and on the route of administration. Thus, for example, a daily dose of 0.25 mg/kg to 10 mg/kg may be suitable for systemic administration.

Compounds of formula (I) and pharmaceutically acceptable derivatives thereof may be prepared by any method known in the art for the preparation of compounds of analogous structure.

Suitable methods for the preparation of compounds of formula (I) and pharmaceutically acceptable derivatives thereof are described below. In the discussion and formulae that follow R^0 to R^3 are as defined in formula (I) above unless otherwise stated; Hal is a halogen, such as Br or I; X^- is a counterion, such as I^- ; NBS is N-bromosuccinimide; NCS is N-chlorosuccinimide; DMF is N,N-dimethylformamide; and alkyl and halogen are as previously defined.

Thus according to a first process (A), compounds of formula (I) may be prepared by reacting a compound of formula (II)

8

(II)

with a boronic acid of formula (III)

(III)

or a suitable derivative thereof in the presence of a suitable transition metal catalyst. Suitable derivatives of formula (III) include boronic acid esters, such as those described in R. Miyaura et al, J. Org. Chem., 1995, 60, 7508-7510. Conveniently, the reaction is carried out in a solvent, such as an ether (e.g. 1,2-dimethoxyethane); in the presence of a base, such as an inorganic base (e.g. sodium carbonate); and employing a palladium catalyst, such as tetrakis(triphenylphosphine)palladium(0).

According to another process (B), compounds of formula (I) wherein R^3 is C_{1-6} alkyl may be prepared by oxidising a compound of formula (IV)

(IV)

under conventional conditions. Conveniently the oxidation is effected using a monopersulfate compound, such as potassium peroxydisulfate (known as OxoneTM) and the reaction is carried out in a solvent, such as an aqueous alcohol, (e.g. aqueous methanol), and at between -78°C . and ambient temperature.

According to another process (C), compounds of formula (I) wherein R^2 is C_{1-6} alkylsulphonyl may be prepared by oxidising a compound of formula (V)

(V)

under conventional conditions. Conveniently the oxidation is effected in the manner described just above for process (B).

9

According to another process (D), compounds of formula (I) wherein R^2 is C_{1-6} alkoxy substituted by one or more fluorine atoms may be prepared by reacting a phenol of formula (VI)

with a haloalkanoalkane under conventional conditions. Conveniently the reaction is effected in a solvent, such as a polar solvent (e.g. DMF), in the presence of a strong base, such as an inorganic hydride (e.g. sodium hydride), at about ambient temperature and using the appropriate bromoalkanoalkane to give the desired compound of formula (I).

According to another process (E), compounds of formula (I) wherein R^3 is NH_2 may be prepared by reacting a compound of formula (X)

with a source of ammonia under conventional conditions. Conveniently the reaction is carried out in a solvent, such as an ester (e.g. ethyl acetate); at ambient or elevated temperature (e.g. ambient temperature); employing ammonium hydroxide as the source of ammonia and using a compound of formula (X) where Hal is Cl.

According to another process (F) compounds of formula (I) may be prepared by interconversion, utilising other compounds of formula (I) as precursors. The following procedures are illustrative of suitable interconversions.

Compounds of formula (I) wherein R^2 represents C_{1-6} alkyl substituted by one or more fluorine atoms may be prepared from the appropriate compound of formula (I) wherein R^2 is C_{1-6} hydroxyalkyl, $C(O)H$ or $C(O)C_{1-6}$ alkyl, by treatment with a suitable source of fluorine. Suitable sources of fluorine include, for example, (diethylamino) sulphur trifluoride. Conveniently the reaction is effected in the presence of a solvent, such as a halogenated hydrocarbon (e.g. dichloromethane), and at reduced temperature, such as $-78^\circ C$.

Compounds of formula (I) wherein R^2 represents $C(O)H$ may be prepared from the corresponding compound of formula (I) wherein R^2 represents CH_2OH by oxidation. Suitable oxidising agents include, for example, manganese (IV) oxide. Conveniently the oxidation is effected in the presence of a solvent, such as a halogenated hydrocarbon (e.g. chloroform), and at elevated temperature (e.g. under reflux).

Compounds of formula (I) wherein R^2 represents C_{1-6} hydroxyalkyl, and wherein the hydroxy group is attached to the carbon linked to the pyridine ring, may be prepared by reduction of the compound of formula (I)

10

wherein R^2 represents the corresponding aldehyde or ketone. Suitable reducing agents include hydride reducing agents, such as diisobutylaluminium hydride. Conveniently the reduction is effected in the presence of a solvent, such as a halogenated hydrocarbon (e.g. dichloromethane), and at reduced temperature, such as $-78^\circ C$.

As will be appreciated by those skilled in the art it may be necessary or desirable at any stage in the synthesis of compounds of formula (I) to protect one or more sensitive groups in the molecule so as to prevent undesirable side reactions.

Another process (G) for preparing compounds of formula (I) thus comprises deprotecting protected derivatives of compounds of formula (I).

The protecting groups used in the preparation of compounds of formula (I) may be used in conventional manner. See, for example, those described in 'Protective Groups in Organic Synthesis' by Theodora W Green and Peter G M Wuts, second edition, (John Wiley and Sons, 1991), incorporated herein by reference, which also describes methods for the removal of such groups.

Acylation of compounds of formula (I) wherein R^3 is NH_2 to provide corresponding acylated benzenesulphonamide derivatives may be carried out by conventional means, for example by employing conventional acylating agents such as those described in 'Advanced Organic Chemistry' by J March, fourth edition, (John Wiley and Sons, 1992), pp 417-424, incorporated herein by reference.

Compounds of formula (II) may be prepared by halogenating compounds of formula (VII)

by conventional means.

Thus esters of formula (VII) are first hydrolysed to their corresponding acids, for example by treatment with a strong base (e.g. sodium hydroxide), in the presence of a solvent (e.g. ethanol) and at elevated temperature. The corresponding acid is then treated with a halogenating agent, conveniently at ambient temperature and in a solvent (e.g. chlorinated hydrocarbon), under which conditions the acid undergoes both halogenation and decarboxylation. Conveniently, the halogenating agent is a brominating agent, such as bromine in the presence of a strong acid (e.g. hydrobromic acid in acetic acid) or NBS, to yield the corresponding compound of formula (II) wherein Hal is bromine.

Esters of formula (VII) may be prepared by reacting a compound of formula (VIII)

US 7,223,772 B1

11

with an aminopyridinium complex of formula (IX)

(IX)

under conventional conditions. Conveniently the reaction is effected in the presence of a base, such as potassium carbonate, a solvent, such as DMF and at ambient temperature.

Compounds of formula (II) may also be prepared by halogenating a compound of formula (XI)

(XI)

by conventional means. Conveniently the halogenation is effected using a brominating agent (e.g. NBS), at ambient temperature and in a solvent (e.g. chlorinated hydrocarbon), to yield the corresponding compound of formula (II) wherein Hal is bromine. Compounds of formula (XI) may be prepared from an azirine of formula (XII)

(XII)

by conventional means. Conveniently the reaction is effected in a solvent, such as an aromatic hydrocarbon (e.g. 1,2,4-trichlorobenzene) and at elevated temperature (e.g. under reflux).

Compounds of formula (XII) may be prepared from an oxime of formula (XIII)

(XIII)

by conventional means. Conveniently the oxime is dissolved in a solvent such as a haloalkane (e.g. dichloromethane), treated with a base, such as an amine (e.g. triethylamine), the mixture cooled to about 0° C. and treated with an anhydride (e.g. trifluoroacetic anhydride), and the mixture then allowed to warm to ambient temperature.

12

Compounds of formula (XIII) may be prepared from a ketone of formula (XIV)

(XIV)

by conventional means. Conveniently the reaction is effected with hydroxylamine or a salt thereof (e.g. hydroxylamine hydrochloride), in a solvent such as an alcohol (e.g. methanol) and at ambient temperature.

Compounds of formula (XIV) may be prepared by reacting a compound of formula (XV)

(XV)

with a compound of formula (XVI)

(XVI)

under conventional conditions. Conveniently the compound of formula (XVI) is a chloro derivative and the reaction is effected in the presence of a strong base, such as an inorganic hydride (e.g. sodium hydride) and at about ambient temperature.

Boronic acids of formula (III) are either known compounds or may be prepared by literature methods such as those described in, for example, EPA publication No. 533268.

Compounds of formula (X) may be prepared by sulphonylating a compound of formula (XVII)

(XVII)

under conventional conditions. Conveniently the sulphonylation is effected using sulphonic acid or a derivative thereof, such as a halosulphonic acid (e.g. chlorosulphonic acid); in the presence of a solvent, such as a halogenated alkane (e.g. dichloromethane); and at between -78° C. and ambient temperature (e.g. -70° C.).

Compounds of formulae (IV), (V) and (VI) and (XVII) may be prepared by methods analogous to those described for the preparation of the corresponding compounds of formula (I).

Compounds of formulae (VIII), (IX), (XV), (XVI) are either known compounds or may be prepared by literature methods such as those described in, for example:

The ampoules, vials or syringes may be aseptically filled (e.g. the solution may be sterilised by filtration and filled into sterile ampoules under aseptic conditions) and/or terminally sterilised (e.g. by heating in an autoclave using one of the acceptable cycles). The solution may be packed under an inert atmosphere of nitrogen.

Preferably the solution is filled into ampoules, sealed by fusion of the glass and terminally sterilised.

Biological Data

Inhibitory activity against human COX-1 and COX-2 was assessed in COS cells which had been stably transfected with cDNA for human COX-1 and human COX-2. 24 Hours prior to experiment, COS cells were transferred from the 175 cm² flasks in which they were grown, onto 24-well cell culture plates using the following procedure. The incubation medium (Dulbecco's modified eagles medium (DMEM) supplemented with heat-inactivated foetal calf serum (10%v/v), penicillin (100 IU/ml), streptomycin (100 µg/ml) and geneticin (600 µg/ml)) was removed from a flask of confluent cells (1 flask at confluency contains approximately 1×10⁷ cells). 10 ml of phosphate buffered saline (PBS) was added to the flask to wash the cells. Having discarded the PBS, cells were then rinsed in 10 ml trypsin for 20 seconds, after which the trypsin was removed and the flask placed in an incubator (37°) for 1-2 minutes until cells became detached from the flask. The flask was then removed from the incubator and cells resuspended in 10 ml of fresh incubation medium. The contents of the flask was transferred to a 250 ml sterile container and the volume of incubation medium subsequently made up to 100 ml. 1 ml cell suspension was pipetted into each well of 4×24-well cell culture plates. The plates were then placed in an incubator (37° C., 95% air/5% CO₂) overnight. If more than 1 flask of cells were required, the cells from flasks were combined before being dispensed into the 24-well plates.

Following the overnight incubation, the incubation medium was completely removed from the 24-well cell culture plates and replaced with 250 µl fresh DMEM (37° C.). The test compounds were made up to 250× the required test concentration in DMSO and were added to the wells in a

volume of 1 μ l. Plates were then mixed gently by swirling and then placed in an incubator for 1 hour (37° C., 95% air/5% CO₂). Following the incubation period, 10 μ l of arachidonic acid (750 μ M) was added to each well to give a final arachidonic acid concentration of 30 μ M. Plates were then incubated for a further 15 minutes, after which the incubation medium was removed from each well of the plates and stored -20° C., prior to determination of prostaglandin E₂ (PGE₂) levels using enzyme immunoassay. The inhibitory potency of the test compound was expressed as an IC₅₀ value, which is defined as the concentration of the compound required to inhibit the PGE₂ release from the cells by 50%. The selectivity ratio of inhibition of COX-1 versus COX-2 was calculated by comparing respective IC₅₀ values. The following IC₅₀ values for inhibition of COX-2 and COX-1 were obtained for compounds of the invention:

Example No.	COX-2: IC ₅₀ (nM)	COX-1: IC ₅₀ (nM)
1 (vii)	34	>100,000
2	548	>100,000

4	34	>100,000
